Outline

- 1. Why adaptive (nonuniform) time steps?
- 2. The α -robust error estimate for nonuniform time steps
- 3. Do we need decay-preserving error estimate for solving parabolic equations with initial singularity?

(ロ)、(型)、(E)、(E)、 E、のQの

Why study the factional calculus?

- Fractional derivative characterizes the evolution of system depending on the history information.
- It is better to describe the experiment data using less parameters for certain phenomena.
- Abnormal diffusion, also known as non-brownian motion (Lévy process)

▲□▶▲□▶▲□▶▲□▶ □ のQで

• We consider the computation for reaction-(sub)diffusion problem,

$$C_0^{\alpha} \mathcal{D}_t^{\alpha} u = \Delta u + f(x, t, u) \quad \text{for } x \in \Omega \text{ and } 0 < t \le T,$$

$$u = u_0(x) \quad \text{for } x \in \Omega \text{ when } t = 0,$$

$$u = 0 \quad \text{for } x \in \partial\Omega \text{ and } 0 < t < T.$$
(1)

• ${}_{0}^{C}\mathcal{D}_{t}^{\alpha}$ denotes the Caputo fractional derivative by

where the kernel $\omega_{\beta}(t) = \frac{t^{\beta-1}}{\Gamma(\beta)}, \quad t > 0.$

$$\blacktriangleright {}_{0}^{C}\mathcal{D}_{t}^{\alpha} = \partial_{t} \text{ with } \alpha = 1$$

◆□▶ ◆□▶ ◆臣▶ ◆臣▶ 臣 のへぐ

Regularity of the solution (解的正则性)

- ► For f = f(x, t), Sakamoto and Yamamoto in J. Math. Anal. Appl., 2011, show $\frac{\partial u}{\partial t} = O(1 + t^{\alpha 1})$ as $t \to 0$ for more general initial data u_0
- For nonlinear equation ${}_{0}^{C}\mathcal{D}_{t}^{\alpha}u = \Delta u + f(u)$: if *f* is Lipschitz continuous, Jin, Li and Zhou in SIUNM 2018, prove that the solution satisfies $\|\partial_{t}u(t)\|_{L^{2}(\Omega)} \leq C_{u}t^{\alpha-1}$

Regularity of the solution (解的正则性)

- ► For f = f(x, t), Sakamoto and Yamamoto in J. Math. Anal. Appl., 2011, show $\frac{\partial u}{\partial t} = O(1 + t^{\alpha 1})$ as $t \to 0$ for more general initial data u_0
- For nonlinear equation ${}_{0}^{C}\mathcal{D}_{t}^{\alpha}u = \Delta u + f(u)$: if *f* is Lipschitz continuous, Jin, Li and Zhou in SIUNM 2018, prove that the solution satisfies $\|\partial_{t}u(t)\|_{L^{2}(\Omega)} \leq C_{u}t^{\alpha-1}$

Blows-up or global existence of the solution (解爆破、全局存在性)

Let us begin with a simple equation

$$u'(t) = u^2, t > 0,$$

 $u(0) = u_0 > 0.$

The unique solution is given by

$$u(t) = \frac{u_0}{1 - u_0 t}$$
 for $t < \frac{1}{u_0}$.

• The solution blows up at the blow-up time $T_b = \frac{1}{u_0}$.

Consider the following differential equation,

$$u'(t) = f(u), t > 0,$$

 $u(0) = u_0 > 0,$

where $u_0 > 0$ is an initial value. To describe the blow-up behavior, we exchange the dependent and independent variables

$$\frac{\mathrm{d}t}{\mathrm{d}u} = \frac{1}{f(u)},$$

and the solution u(t) satisfies

$$t = \int_{u_0}^{u(t)} \frac{1}{f(u)} \mathrm{d}u.$$

Theorem 1

Assume that f(u) is positive for all u > 0. Then all solutions blow up in finite time if and only if

$$\int_{u}^{\infty} \frac{1}{f(x)} \mathrm{d}x < \infty \text{ for all } u > 0, \tag{2}$$

< □ > < 同 > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > <

which is the Osgood's condition found in 1898.

Li et al. 2018 and Yang and Zhang, Zhao, 2019 show that fractional ODEs and PDEs have a finite time blow-up if and only if

$$\int_{u_0}^{\infty} \left(\frac{u}{f(u)}\right)^{1/\alpha} \frac{du}{u} < \infty.$$

◆□▶ ◆□▶ ◆ □▶ ◆ □▶ ○ □ ○ ○ ○ ○

Why adaptive time steps?

• The weak regularity of the solution at t = 0;

The solution may grow fast far away from t = 0, such as blowup for nonlinear case.

Recently, a refined error estimate has been presented by:

- Chen and Stynes. Blow-up of error estimates in time-fractional initial-boundary value problems. *IMA J. Numer. Anal.*, 2021.
- Huang and Stynes. α-robust error analysis of a mixed FEM for a time-fractional biharmonic equation. Numer. Alogr., 2021.
- Huang, Stynes, and Chen. An α-robust FEM for a multi-term time-fractional diffusion problem. *JCAM*, 2021.
- Wang and Stynes. An α-robust finite difference method for a time-fractional radially symmetric diffusion problem. CMA, 2021.
- One of the main defects in the existing analysis is the mesh restriction for the consistence error arose from the discrete scheme of the Caputo derivative, i.e., the analysis depends on the precise form of graded mesh $t_n = (k/N)^{\gamma}$ with $\gamma \ge 1$.

But, the α-robust analysis of various schemes on general nonuniform meshes still remains incomplete.

Part I

The α -error estimate for L1 scheme on general nonuniform time step

(ロト・日本)・モン・モン・モー のへの

General nonuniform time steps

- The time steps should be nonuniform because it fits for more general problems.
- Consider the time-step size $\tau_k = t_k t_{k-1}$ for nonuniform time mesh $0 = t_0 < \cdots < t_{k-1} < t_k < \cdots < t_N = T$.

• Let $g^k = g(t_k)$ and difference operator $\nabla_{\tau} g^k = g^k - g^{k-1}$.

► The nonuniform L1 formula¹ of Caputo derivative with $v'(s) \approx \nabla_{\tau} v^k / \tau_k$ is given by

$$(\mathcal{D}_{\tau}^{\alpha} v)^{n} := \sum_{k=1}^{n} A_{n-k}^{(n)} \nabla_{\tau} v^{k} \quad \text{with} \quad A_{n-k}^{(n)} := \frac{1}{\tau_{k}} \int_{t_{k-1}}^{t_{k}} \omega_{1-\alpha}(t_{n}-s) \,\mathrm{d}s, \quad (3)$$

with (Liao et al 18' SINUM)

$$A_0^{(n)} > A_1^{(n)} > A_2^{(n)} > \dots > A_{n-1}^{(n)} > 0 \quad \text{for } 1 \le n \le N,$$
 (4)

¹Sun and Wu, 06' and Lin & Xu, 07'

The nonuniform L1 scheme

One has a nonuniform L1 scheme for the problem (1)

$$(\mathcal{D}_{\tau}^{\alpha}u_{i})^{n} - \Delta_{h}u_{i}^{n} = \kappa u_{i}^{n}, \ 1 \leq n \leq N,$$

$$u_{i}^{n} = u_{b}(x_{i}, t_{n}), \quad x_{i} \in \partial\Omega_{h}, \ 1 \leq n \leq N,$$

$$u_{i}^{0} = u^{0}(x_{i}), \quad x_{i} \in \bar{\Omega}_{h}.$$
(5)

$${}_{0}^{C}\mathcal{D}_{t}^{\alpha}u=\Delta u+\kappa u.$$

Stability analysis by using the inequality $\frac{1}{2} {}_{0}^{C} \mathcal{D}_{l}^{\alpha} u^{2} \leq u_{0}^{C} \mathcal{D}_{l}^{\alpha} u$,

 $\frac{1}{2} {}_0^{\mathsf{C}} \mathcal{D}_t^{\alpha} \|u\|^2 \le \kappa \|u\|^2.$

The semigroup property of RL integral that $\mathcal{I}^{\alpha}\mathcal{I}^{\beta}u = \mathcal{I}^{\alpha+\beta}u$ implies

$$\mathcal{I}^{\alpha \, \mathcal{C}}_{0} \mathcal{D}^{\alpha}_{t} u := \mathcal{I}^{\alpha} \mathcal{I}^{1-\alpha} u' = \int_{0}^{t} u'(s) \, \mathrm{d}s$$

It is easy to have

$$||u||^2 \le ||u_0||^2 + \kappa \int_0^t \omega_\alpha(t-s) ||u||^2(s) ds.$$

• If $\kappa \leq 0$, we arrive at

 $\|u\|^2 \le \|u_0\|^2.$

 For κ > 0, standard integral-type Grönwall inequality produces

$$\|u\|^2 \leq E_{\alpha}(2\kappa t^{\alpha})\|u_0\|^2.$$

Stability analysis for L1 scheme (5)

$$\left(\mathcal{D}_{\tau}^{\alpha}u_{i}\right)^{n}-\Delta_{h}u_{i}^{n}=\kappa u_{i}^{n}.$$

The inequality $u^n (\mathcal{D}_{\tau}^{\alpha} u)^n \geq \frac{1}{2} (\mathcal{D}_{\tau}^{\alpha} u^2)^n$, $\forall \{u^k\}_{k=0}^n$ holds if and only if $A_0^{(n)} \geq A_1^{(n)} \geq \cdots \geq A_{n-1}^{(n)} \geq 0$

$$\Rightarrow \frac{1}{2} (\mathcal{D}_{\tau}^{\alpha} \|u\|^2)^n \le \kappa \|u\|^2.$$

Stability analysis for L1 scheme (5) $((\mathcal{D}_{\tau}^{\alpha}u_{i})^{n} - \Delta_{h}u_{i}^{n} = \kappa u_{i}^{n}.)$

> ► The inequality $u^{n}(\mathcal{D}_{\tau}^{\alpha}u)^{n} \geq \frac{1}{2}(\mathcal{D}_{\tau}^{\alpha}u^{2})^{n}, \forall \{u^{k}\}_{k=0}^{n} \text{ holds if}$ and only if $A_{0}^{(n)} \geq A_{1}^{(n)} \geq \cdots \geq A_{n-1}^{(n)} \geq 0$

$$\implies \frac{1}{2} \left(\mathcal{D}_{\tau}^{\alpha} \| u \|^2 \right)^n \le \kappa \| u \|^2.$$
 (15)

For
$$\kappa \leq 0$$
, using the DCC kernels $p_{n-k}^{(n)}$, one has

$$||u^n|| \le ||u^0||.$$

For κ > 0, the discrete Grönwall inequality produces

$$\|u^n\| \le C_u E_\alpha (4\kappa t_n^\alpha) \|u^0\|. \tag{16}$$

(日)

Convergence analysis

To analyze the convergence of the scheme (5), we introduce the error function $e_i^n = U_i^n - u_i^n$ for $x_i \in \overline{\Omega}_h$, $0 \le n \le N$, which satisfies the initial error $e_i^0 = 0$ and governing equation

$$\left(\mathcal{D}_{\tau}^{\alpha}-\Delta_{h}-\kappa\right)e_{i}^{n}=\left(R_{t}\right)_{i}^{n}+\left(R_{s}\right)_{i}^{n},\quad x_{i}\in\Omega_{h},$$

where $(R_t)_i^n$ and $(R_s)_i^n$ represent the truncation errors in time and space as

$$(R_t)_i^n = {}_0^{\alpha} \mathcal{D}_t^{\alpha} u(x_i, t_n) - \mathcal{D}_{\tau}^{\alpha} u(x_i, t_n), (R_s)_i^n = \Delta u(x_i, t_n) - \Delta_h u_i^n.$$

Theorem 4 (Discrete fractional Grönwall inequality, SINUM 2018) For any finite time $t_N = T > 0$ and $\kappa \ge 0$, the error satisfies

 $\mathcal{D}_{\tau}^{\alpha} \|e^{n}\|^{2} \leq 2\kappa \|e^{n}\|^{2} + 2\|e^{n}\| \left(\left| (R_{t})^{n} \right| + \left| (R_{s})^{n} \right| \right), \quad n \geq 1.$

If the maximum time-step size $\tau_N \leq \sqrt[\alpha]{\frac{1}{4\kappa\Gamma(2-\alpha)}}$ and $\kappa > 0$, it holds

$$\left\|e^{n}\right\| \leq C_{u}E_{\alpha}(4\kappa t_{n}^{\alpha})\Big(\max_{1\leq j\leq n}\sum_{l=1}^{j}p_{j-l}^{(j)}\big|(R_{t})^{l}\big| + \omega_{1+\alpha}(t_{n})\max_{1\leq k\leq n}\big|(R_{s})^{n}\big|\Big).$$

It can be proved by mathematical induction!!!

Theorem 4 (Discrete fractional Grönwall inequality, SINUM 2018) For any finite time $t_N = T > 0$ and $\kappa \ge 0$, the error satisfies

 $\mathcal{D}_{\tau}^{\alpha} \|e^{n}\|^{2} \leq 2\kappa \|e^{n}\|^{2} + 2\|e^{n}\| \left(|(R_{t})^{n}| + |(R_{s})^{n}| \right), \quad n \geq 1.$

If the maximum time-step size $\tau_N \leq \sqrt[\alpha]{\frac{1}{4\kappa\Gamma(2-\alpha)}}$ and $\kappa > 0$, it holds

$$\left\|e^{n}\right\| \leq C_{u}E_{\alpha}(4\kappa t_{n}^{\alpha})\Big(\max_{1\leq j\leq n}\sum_{l=1}^{j}p_{j-l}^{(j)}\big|(R_{t})^{l}\big| + \omega_{1+\alpha}(t_{n})\max_{1\leq k\leq n}\big|(R_{s})^{n}\big|\Big).$$

It can be proved by mathematical induction!!!

Local consistency error

• Under the regularity assumption $\|\partial_x^{(4)}u(t)\|_{L^2} \leq C_u$, the spacial truncation error satisfies $|((R_s))^n| \leq C_u h^2$.

Rewrite the definition of L1 scheme as

$$(\mathcal{D}_{\tau}^{\alpha} v)^{n} = A_{0}^{(n)} v^{n} - \sum_{k=1}^{n-1} \left(A_{n-k-1}^{(n)} - A_{n-k}^{(n)} \right) v^{k} - A_{n-1}^{(n)} v^{0} ,$$

The temporal mesh grid information is unknown.
 Our finding: (R_t)^j is bounded by a discrete convolution form,

(ECS estimate)
$$|(R_t)^n| \le A_0^{(n)} G_{\text{loc}}^n + \sum_{k=1}^{n-1} (A_{n-k-1}^{(n)} - A_{n-k}^{(n)}) G_{\text{his}}^k,$$

where $G_{loc}^n = G_{his}^n$ with

$$G_{\text{his}}^{k} \triangleq \int_{t_{k-1}}^{t_{k}} \left(\mu - t_{k-1}\right) \left|g''(\mu)\right| \, \mathrm{d}\mu \,, \quad 1 \le k \le n-1.$$

Local consistency error

• Under the regularity assumption $\|\partial_x^{(4)}u(t)\|_{L^2} \leq C_u$, the spacial truncation error satisfies $|((R_s))^n| \leq C_u h^2$.

Rewrite the definition of L1 scheme as

$$(\mathcal{D}_{\tau}^{\alpha}v)^{n} = A_{0}^{(n)}v^{n} - \sum_{k=1}^{n-1} \left(A_{n-k-1}^{(n)} - A_{n-k}^{(n)}\right)v^{k} - A_{n-1}^{(n)}v^{0},$$

• The temporal mesh grid information is unknown.

• Our finding: $(R_t)^j$ is bounded by a discrete convolution form,

(ECS estimate)
$$|(R_t)^n| \le A_0^{(n)} G_{\text{loc}}^n + \sum_{k=1}^{n-1} (A_{n-k-1}^{(n)} - A_{n-k}^{(n)}) G_{\text{his}}^k,$$

where $G_{loc}^n = G_{his}^n$ with

$$G_{\text{his}}^{k} \triangleq \int_{t_{k-1}}^{t_{k}} \left(\mu - t_{k-1}\right) \left|g''(\mu)\right| \, \mathrm{d}\mu \,, \quad 1 \le k \le n-1.$$

Global consistency error

Global consistency error (Liao, Li, Z., SINUM, '18)

$$\begin{split} \sum_{j=1}^{n} p_{n-j}^{(n)} |(R_{l})^{j}| &\leq \sum_{k=1}^{n} p_{n-k}^{(n)} A_{0}^{(k)} G_{\text{loc}}^{k} + \sum_{k=1}^{n} p_{n-k}^{(n)} \sum_{j=1}^{k-1} \left(A_{k-j-1}^{(k)} - A_{k-j}^{(k)} \right) G_{\text{his}}^{j} \\ &\leq \sum_{k=1}^{n} p_{n-k}^{(n)} A_{0}^{(k)} G_{\text{loc}}^{k} + \sum_{j=1}^{n-1} G_{\text{his}}^{j} \sum_{k=j+1}^{n} \left(A_{k-j-1}^{(k)} - A_{k-j}^{(k)} \right) p_{n-k}^{(n)} \\ &\leq \sum_{k=1}^{n} p_{n-k}^{(n)} A_{0}^{(k)} G_{\text{loc}}^{k} + \sum_{k=1}^{n-1} p_{n-k}^{(n)} A_{0}^{(k)} G_{\text{his}}^{k} \\ &\leq 2 \sum_{k=1}^{n} p_{n-k}^{(n)} A_{0}^{(k)} G_{\text{loc}}^{k}. \end{split}$$

Note that, the cyan term denotes the global consistency error of local part in $[t_{j-1}, t_j]$, and the red term is the global consistency error of historical part over $[t_0, t_{j-1}]$.

Global consistency error

Global consistency error (Liao, Li, Z., SINUM, '18)

$$\begin{split} \sum_{j=1}^{n} p_{n-j}^{(n)} |(R_{t})^{j}| &\leq \sum_{k=1}^{n} p_{n-k}^{(n)} A_{0}^{(k)} G_{\text{loc}}^{k} + \sum_{k=1}^{n} p_{n-k}^{(n)} \sum_{j=1}^{k-1} \left(A_{k-j-1}^{(k)} - A_{k-j}^{(k)} \right) G_{\text{his}}^{j} \\ &\leq \sum_{k=1}^{n} p_{n-k}^{(n)} A_{0}^{(k)} G_{\text{loc}}^{k} + \sum_{j=1}^{n-1} G_{\text{his}}^{j} \sum_{k=j+1}^{n} \left(A_{k-j-1}^{(k)} - A_{k-j}^{(k)} \right) p_{n-k}^{(n)} \\ &\leq \sum_{k=1}^{n} p_{n-k}^{(n)} A_{0}^{(k)} G_{\text{loc}}^{k} + \sum_{k=1}^{n-1} p_{n-k}^{(n)} A_{0}^{(k)} G_{\text{his}}^{k} \\ &\leq 2 \sum_{k=1}^{n} p_{n-k}^{(n)} A_{0}^{(k)} G_{\text{loc}}^{k}. \end{split}$$

Note that, the cyan term denotes the global consistency error of local part in $[t_{j-1}, t_j]$, and the red term is the global consistency error of historical part over $[t_0, t_{j-1}]$.

Global convergence

Lemma 5 (Liao, Li, Z., SINUM, '18) Assume $u \in C^2((0, T])$ and there exists a constant $C_u > 0$ such that

 $|u''(t)| \le C_u (1 + t^{\sigma - 2}), \quad 0 < t \le T,$ (17)

where $\sigma \in (0,1) \cup (1,2)$ is a regularity parameter. Then

$$\sum_{j=1}^{n} p_{n-j}^{(n)} \left| (R_t)^j \right| \le C_u \left(\tau_1^{\sigma} / \sigma + \frac{1}{1-\alpha} \max_{2 \le k \le n} (t_k - t_1)^{\alpha} t_{k-1}^{\sigma-2} \tau_k^{2-\alpha} \right).$$

Global convergence (Liao, Li, Z., SINUM, '18)

• Uniform mesh: Taking $\tau = TN^{-1}$ and $t_k = k\tau$, we have

$$\sum_{j=1}^{n} p_{n-j}^{(n)} |(R_t)^j| \le C_g \Big(\tau^{\sigma} / \sigma + \frac{1}{1-\alpha} T^{\sigma-\min\{\sigma,2-\alpha\}} \tau^{\min\{\sigma,2-\alpha\}} \Big).$$

- ► As expected, the convergence order increases when the initial regularity of solution improves for $\sigma \le 2 \alpha$
- but the accuracy barrier is of order $O(\tau^{2-\alpha})$.

Global convergence (Liao, Li, Z., SINUM, '18)

Nonuniform mesh (Graded mesh): $t_k = T (k/N)^{\gamma}$ with the parameter $\gamma > 1$, we have

$$\sum_{j=1}^{n} p_{n-j}^{(n)} |(R_t)^j| \leq C_g T^{\sigma} \Big(\frac{1}{\sigma} N^{-\gamma\sigma} + \frac{\gamma^2 4^{\gamma-1}}{1-\alpha} N^{-\min\{\gamma\sigma, 2-\alpha\}} \Big).$$

▲□▶▲□▶▲□▶▲□▶ □ のQで

The accuracy barrier is O(N^{α−2})
 The accuracy is O(N^{−min (σγ,2−α)})

The α -blow-up phenomenon

• The most error bounds contain a factor $\frac{1}{1-\alpha} \to \infty$ as $\alpha \to 1^-$.

• This is the so-called α -blowup phenomenon

▶ Jin, Li and Zhou, SINUM 2019 :

"This phenomenon does not fully agree with the results for the continuous model ...and it is of interest to further refine the estimates to fill in the gap."

The α -robust error estimate on general nonuniform mesh

Lemma 6 (Z., Zhang and Zhao, 2022²) Assume $u \in C^2((0,T])$ and there exists a constant $C_u > 0$ such that

$$|u''(t)| \le C_u (1 + t^{\sigma - 2}), \quad 0 < t \le T,$$
(18)

where $\sigma \in (0,1) \cup (1,2)$ is a regularity parameter. Then

$$\sum_{j=1}^n p_{n-j}^{(n)} \left| (\mathbf{R}_t)^j \right| \leq C_u \Big(\frac{\tau_1^{\sigma}}{\sigma} + \Gamma(2-\alpha) \sum_{j=2}^n \tau_j \max_{j \leq k \leq n} t_k^{\alpha-1} t_{k-1}^{\sigma-2} \tau_k^{2-\alpha} \Big).$$

Typical widely-used meshes

• Uniform mesh: Taking the time step: $\tau = TN^{-1}$ and $t_k = k\tau$

• Graded mesh: $t_k = T (k/N)^{\gamma}$ with the parameter $\gamma \ge 1$

The general graded mesh

M1. There is a constant C_1, C_γ such that $\tau_1 \ge C_1 \tau^\gamma$ and $\tau_k \le C_\gamma \tau \min\{1, t_k^{1-1/\gamma}\}$ for $1 \le k \le N, t_k \le C_\gamma t_{k-1}$ and $\tau_k \le C_\gamma \tau_{k-1}$ for $2 \le k \le N$.

Part II

Do we need decay-preserving error estimate for solving parabolic equations with initial singularity?

◆□▶ ◆□▶ ◆ □▶ ◆ □▶ ─ □ ─ つへぐ

Motivation

Consider

$$\partial_t^{\alpha} u - \Delta u = \kappa u + f, \quad x \in \Omega, \ t \in (0, T],$$
(20)

Under the regularity condition

$$\|\partial_t u(t)\|_{L^2(\Omega)} \le Ct^{\alpha-1}$$

The above α -error estimate for L1 scheme on uniform mesh holds

$$\|e\|_{\infty} := \max_{1 \le n \le N} \|e^n\| \le C\tau^{\alpha}.$$

• But, sometimes, one is interesting in error $||e^N||$ at time level N.

► The point-wise error $||e^n|| \le C\tau t_n^{\alpha-1}$ (see Jin, Li and Zhou and Qin, Li and Z., JCM 23⁶)

One can observe the following interesting phenomena.

• Assume the regularity: $\|\partial_t u(t)\|_{L^2(\Omega)} \leq Ct^{\alpha-1}$

Set $\Omega = (0, L)$ and exact solution $u = t^{\alpha} \sin(\pi x/L)$ with $\alpha = 0.5$

Table: Convergence rates of L1 scheme by taking various L, κ and T,.

| Ν | | L = 1 | | | $L = \pi$ | | |

The above shows various convergence rates for different model parameters (i.e., Ω , *T*, and reaction coefficient κ).

- This elusive phenomena cannot be explained by error estimates in previous literatures as their theory does not involve the influence of model parameters.
- This inconsistence between numerical experiments and theoretical analysis has been puzzling us for a long time, and motivating us to find what goes on behind scenes and to uncover the mystery.
- The similar behavior happens to the classical model?

$$\partial_t u - \Delta u = \kappa u + f, \quad x \in \Omega, \ t \in (0, T],$$
(21)

with initial value $U^0 = u_0$.

Noting BDF2 needs two starting values, we here use IE scheme to compute U¹.

• A point-wise decay-preserving ($\kappa < 0$) error estimate for ODEs:

$$|e^n| \leq e^{C\kappa t_n} |e^0| + C_u \Big(\frac{e^{C\kappa t_n} \tau^{\alpha}}{1 + Ct_{n-1}^{\alpha-1} \tau^k} \Big),$$

- From a theoretical point of view, τ^{α} is the leading order as $\tau \to 0$.
- However, due to limited computational resources, we can only take a finite N in practice.
- Once *N* is finite (i.e., τ is not infinitesimal), the coefficients of τ^{α} and τ^{k} will play an important role to determine which is dominant.
- As we know, exponential decay is much faster than the algebraic decay and thus the two coefficients are two scales for some κ and T.

A point-wise decay-preserving ($\kappa < 0$) error estimate for ODEs:

$$|e^n| \leq e^{C\kappa t_n} |e^0| + C_u \left(e^{C\kappa t_n} \tau^{\alpha} + Ct_{n-1}^{\alpha-1} \tau^k \right),$$

Conclusion

- We provide a new decay-preserving error estimate to study numerical behavior of widely used IE, C-N and BDF2 schemes.
- ▶ The error estimate consists of two components: $e^{-C(\lambda_1 \kappa)T}\tau^{\alpha}$ and $T^{\alpha-k}\tau^k$, where λ_1 is the minimal eigenvalue.
- The estimate shows various convergence rates are caused by the trade-off between two components in different model parameter regimes.
- Our decay-preserving error estimates succeed to capture the different states of convergence rate where the traditional error estimates fail because we take the model parameters into account and thus retain more properties of continuous equations.
- We only present a conjecture on the decay-preserving error estimate of L1 scheme for sub-diffusion equations!!!

Fast algorithm

• Using the identity $\frac{1}{t^{\alpha}} = \frac{1}{\Gamma(\alpha)} \int_0^{\infty} e^{-t \cdot s} s^{\alpha - 1} ds$

• we use SOE to approximate the power function:

$$\left|\frac{1}{t^{\alpha}} - \sum_{i=1}^{N_{\exp}} \omega_i e^{-s_i t}\right| \le \varepsilon, \quad t \in [\delta, T].$$
(30)

Table: # of exponentials needed to approximate $t^{-\alpha}$.

数值挑战:长记忆困难

- ▶ 实际地球物理应用中,分数阶非常小,通常在0.006-0.06量级
- ▶ Abel核非常平坦,常规离散方法有"长记忆"困难

▶ 我们的贡献:

- ▶ 设计了基于SOE快速格式,克服了"长记忆"挑战
 - 已有格式需要保留500层记忆,对于256³的空间网格规模需内存超过500多GB,且长时间模拟精度难以保证
 - ▶ 我们只需存(小于等于)10层中间变量就可以实现10⁻³量级的相对 误差,对于256³的空间网格规模需内存为10GB

▶ 结合多尺度Strang分裂格式,实现了三维地震波方程的高效求解

图: 与参考解定量验证(左), 在时间方向严格二阶收敛(右)
